

Graphical User Interface and Command Line Interface are, essentially, two different ways of doing the same thing. Graphical User Interface (GUI) uses pictures and icons to help the user navigate through their computer. For example, clicking on an image of a folder to access their file storage. Command Line Interface (CLI) meanwhile, is the use of text to navigate one's computer. Both of these systems have their own advantages. GUI uses pictures so it might be easier to learn and doesn't require much skill in typing. Conversely, CLI is faster since, as long as you know the proper commands, the only action needed is typing.
